

ENIAC

Discount Strategy Analysis

Our Recommendation

ENIAC

Discounts have a **moderate positive effect on revenue, but seasonal demand and protecting margins on top-performing products are the primary revenue drivers.**

Revenue and Orders Follow the Same Trend

ENIAC

Monthly
Orders

Monthly
Revenue
(€ Millions)

Revenue varies dramatically while Discounts stay Flat

ENIAC

Discounted Orders: 21% Larger Baskets, but Only 7.5% Higher Spending

ENIAC

94% of orders include a discount

Only **6%** are non-discounted

15% of Sold Products Generate 80% of Revenue

ENIAC

TOP 20% OF SOLD PRODUCTS

85% of revenue
20.0% average discount

REMAINING 80% OF PRODUCTS

15% of revenue
26% average discount

Average discounts are weighted by units sold. Revenue is sales value, not profit.

Three Opportunities to Optimize Discounting

ENIAC

1

Review discount scope: 96.5% of products discounted at avg 24% leaves room for more selective pricing

2

Q4 generated **€3.1M**, more than any other quarter, at the **lowest discount level** (23%). With **only one Q4** in our dataset, **more data** is needed to confirm this **pattern**, but it suggests that **seasonal demand** may matter more than discount levels.

3

Improve data infrastructure: 42% of promotional price data was unusable, limiting deeper analysis

Data Limitations

ENIAC

Limitations:

- ~26% of orderlines and ~48% of products excluded due to data quality issues
- Promotional price data unavailable (42% corrupted)
- Negative prices in data , source unconfirmed

Recommendations for Data Collection

ENIAC

Standardize Price Formats

Fix Promo Price Storage
